The present invention relates to magnetic resonance imaging (MRI) using magnetization preparation. One of the most intriguing aspects of MRI is the many different ways that the MR signal can be generated and interpreted. In some cases, it is desirable to obtain a specific tissue (e.g., prostate, colon) contrast prior to MRI. In one type of contrast preparation the magnetic field is first applied and then turned off. With a current imaging sequence, the signal that is detected is mostly water as the field has not yet been turned off. Once the field is turned off, all magnetization and resulting MR signal is generated in the tissue. Ideally, the total magnetization in the tissue would be zero after the field is turned off. In another type of contrast preparation, the magnetic field is applied for a time and then turned off. After the field is turned off, the MR signal is generated in all tissues. The problem with this approach is that, although all tissues will have a signal, the MR signal is now a composite of all the different types of tissues and their magnetization (M), such as gray matter (GM), white matter (WM), myelinated tissue, cerebrospinal fluid (CSF), etc. To have a meaningful interpretation, the MR signal must be separated into the different tissues. To do this, one must consider the fact that the different tissues have different magnetization decay times, and thus one must create a preparation sequence that provides a different decay time for each tissue to be differentiated. The creation of such a preparation sequence can be challenging. The invention relates to magnetization preparation for MRI. The invention provides methods for generating magnetization in a volume of interest in a body and for using the magnetization to create an MR signal in the volume of interest in the body. In some embodiments, the invention provides a novel preparation sequence. In some embodiments of the invention, magnetization is first generated in one or more tissues and is later used to create MR signal in the volume of interest in the body. In some 82157476af
